

Student's Projects Exercise 4 (Maia Arrais)

1. Sophie's Tarot Reading

<https://sophiesanchez.pythonanywhere.com/>

Sophie's tarot reading project was super quirky and fun, it wanted to have a personalized feeling so everyone has a different experience and it showed you kind of that. Right away, the design sets the mood with dark background, glowing purple elements, and little star accents that make it feel like a tarot space. What I liked the most is how the experience feels very nice and thorough with not confusing steps. You type your name, your birth month, and a question, and it gives you a card. The nice part is that you can choose to make your question private or public, which honestly feels respectful and thoughtful because some questions can be personal.

I also really liked the "Collective Readings" section. It makes the whole site feel alive because you can see what other people got and compare your results. It attaches to what we've been learning in class about interactivity and fetching/displaying collaborative information. Even though the cards are assigned randomly for now, but Sophie's idea for the future of making the card match the type of question you ask, is super interesting. It would make the readings feel way more connected to the user.

Overall, the project is simple, but in a good way. It feels complete and has a clear vibe. It's the kind of thing you want to try again just to see what card you get next. I think Sophie did a great job combining personal interaction, visuals, and a small touch of mystery.

2. Julia & Olivia's Fortune Rookie

<https://github.com/olivax28/CART351/tree/main/Projects/project02>

Julia and Olivia's fortune project was super fun to participate in because it feels like an old-school fortune-teller booth but on a computer. What I found really

clever is how the fortune you get depends on the last two numbers of your birth year. Instead of being totally random, you fall into one of four categories, and your fortune is based on that. It's simple logic, but it makes you feel like the system "knows" you a little bit.

The visuals go according to the theme, the patterned background that feel like a drape from a fortune teller booth, the bright text, and the fortune boxes on the right all make the page feel playful and energetic. I also loved the history section where all past fortunes appear. That part actually made the experience more fun because you can read what other people got and then try different inputs yourself. It's kind of a "Friend's collective reader" because you can compare you results to those of your friends.

The interaction of pressing ENTER three times (once for name, once for birth year, and once for the fortune) gives the whole thing a quirky rhythm. It almost feels like steps in a ritual. I think the whole project works really well because it doesn't try to do too much and it sticks to its concept and makes it enjoyable.

3. Ethan's This or That

<https://github.com/Sharp-steel/cart351/tree/main/Projects/Project2>

Ethan's "This or That" project ended up being a lot more interesting than I expected at first glance. When you open it, you start with a simple, clean screen, just one question and two big buttons. But once you begin, you realize it's actually a sequence of either/or questions. The smooth progression makes it really easy to keep clicking through without overthinking, and the choices feel fun and light, just a session of commonly asked questions.

What I liked the most was the ending. After you finish answering everything, the site shows you the common results from other people who filled out the questionnaire. That part adds a really cool social aspect, because suddenly your answers aren't just forgotten, you get to see how similar or different you are from everyone else. It feels almost like a mini personality snapshot, but based on collective data instead of a quiz "score."

Design-wise, the project is very simple and goes straight to the point. It feels modern and easy to understand however it would be nice for a game like this

which is very common to find online, to be a little more adventurous in the design. Maybe more colors or a more vibrant background. Regardless, it loads quickly and feels smooth, which makes the whole interaction enjoyable. The multiple-question flow keeps you clicking, and the final comparison screen gives the experience a nice payoff. It's polished, easy to use, and actually fun to do more than once to see how your results compare.
